Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1–25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26–160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Macdonald, A.L. 1990. The Indian food fishery of the Fraser River: 1989 summary. Can. Data Rep. Fish. Aquat. Sci. 787: 111 p.

Estimates of weekly effort levels, catches, and catch per unit of effort of five species of Pacific salmon and steelhead (**Oncorhynchus** spp.) and sturgeon (**Acipenser** spp.) are reported for all 23 fishing areas of the Fraser River Indian food fishery in 1989. The annual catch of 674,023 salmon and steelhead was the highest on record. The catch by species was 5,983 chinook salmon (**O. tshawytscha**), 571,943 sockeye salmon (**O. nerka**), 72,443 pink salmon (**O. gorbuscha**), 10,245 coho salmon (**O. kisutch**), 12,785 chum salmon (**O. keta**), 624 steelhead (**O. mykiss**), and 4,086 sturgeon. A standard management plan was amended because conservation of early and middle run chinook stocks was required. For the fourth consecutive year, in-season management actions were taken in an attempt to achieve an allocation of 500,000 sockeye for the entire fishery.

Key words: Indian food fishery, Fraser River, effort, catch, conservation, allocation.

RÉSUMÉ

Macdonald, A.L. 1990. The Indian food fishery of the Fraser River: 1989 summary. Can. Data Rep. Fish. Aquat. Sci. 787: 111 p.

On présente les niveaux d'effort hebdomadaire, les prises, et les prises par unité d'effort pour cinq espèces de saumon du pacifique et la truite arc-en-ciel anadrome (genre **Oncorynchus**) et esturgeon (genre **Acipenser**), ceci pour les 23 zones de pêche touchant la peche de subsistance des autochtones dans le fleuve Fraser en 1989. Une capture annuelle totale de 674 023 saumons et truite arc-en-ciel anadromes représente les plus importance jamais enregistrée. Les prises par espèces ont été les suivantes: 5 983 saumons quinnats (**O. tshawytscha**), 571 943 saumons rouge (**O. nerka**), 72 443 saumons roses (**O. gorbuscha**), 10 245 saumons coho (**O. kisutch**), 12 785 saumon ketas (**O. keta**), 624 tuites arc-en-ciel anadromes (**O. mykiss**) et 4 086 esturgeons. On a modifié un plan de gestion normalisé de la pêche dans le but d'assurer la conservation des stocks de saumon quinnat à remontée hâtive et intermédiaire. Pour la quatrième anneé consécutive, on a instauré des gestion afin d'achever une allocation de 500 000 saumons rouge pendant la saison.

Mots-cles: pêche de subsistance des autochtones, fleuve Fraser, effort, prises, conservation, allocation.

INTRODUCTION

Management plans for the Fraser River Indian food fishery (IFF) in 1989 and estimates of resultant effort, catch, and catch per unit of effort (CPUE) of salmon and steelhead (**Oncorhynchus** spp.) and sturgeon (**Acipenser** spp.) are documented in this report. Management plans and salmonid catch, effort, and CPUE estimates for the IFF for the 1951 to 1982 period were compiled by Schubert (1983) and have been published annually since 1983 (Schubert 1984, 1985, 1986; Macdonald 1987, 1988, 1989).

This report provides a brief description of fishing areas and gear, an overview of management processes, an annual catch summary, details of data organization and interpretation, management plans, and tabulated estimates of weekly effort, catch, and CPUE by the IFF in 1989.

FISHING AREAS AND GEAR

The Fraser River watershed is divided into 23 areas to facilitate data collection and documentation. Areas are delineated by the locations described briefly below and shown in Fig. 1. The watershed is divided into two administrative districts by the Department of Fisheries and Oceans (DFO). Districts 1 and 2 represent, respectively, all areas upstream and downstream of North Bend. The following descriptions indicate the distance of the area boundaries from Steveston (near the mouth of the Fraser River) in brackets and gear types used in each area.

Steveston Area (below 9.6 km); drifted gill nets. The North Arm of the Fraser River downstream of the Knight Street bridge; the Middle Arm of the Fraser River between Swishwash and Lulu Islands; and Ladner Reach, Sea Reach, and Canoe Passage in the Main Arm of the Fraser River.

Deas Island (9.6 km) to Mission (75 km); set gill nets. The main arm of the Fraser River from the westerly end of Deas Island upstream to Mission; and the North Arm of the Fraser River upstream from the Knight Street bridge.

Mission (75 km) to Hope (151 km); set gill nets. Prior to 1987, data for this area was compiled for north and south side sub-areas of the mainstem, each extending from Mission to Hope. Since 1987, the north and south side sub-areas have been combined for data collection and documentation.

Hope (151 km) to North Bend (206 km); set gill nets. This area encompasses a permanently closed 8 km section of the Fraser River that extends from Williams Creek (191.5 km), 2.8 km south of Hell's Gate, to Petch Creek (199.5 km), 5.2 km north of Hell's Gate. The closed area protects salmon stocks passing an obstruction at Hell's Gate.

North Bend (206 km) to Texas Creek (280 km); set gill nets and dip nets. Prior to 1976, this area was North Bend to Lytton (236 km). Texas Creek flows into the Fraser River 18 km south of Lillooet.

Texas Creek (280 km) to Churn Creek (430 km); set gill nets and dip nets. Prior to 1976, this area was Lytton to Churn Creek.

Churn Creek (430 km) to Chilcotin Bridge (491 km); dip nets. Chilcotin Bridge (also known as Sheep Creek bridge) crosses the Fraser River 20 km south of Williams Lake.

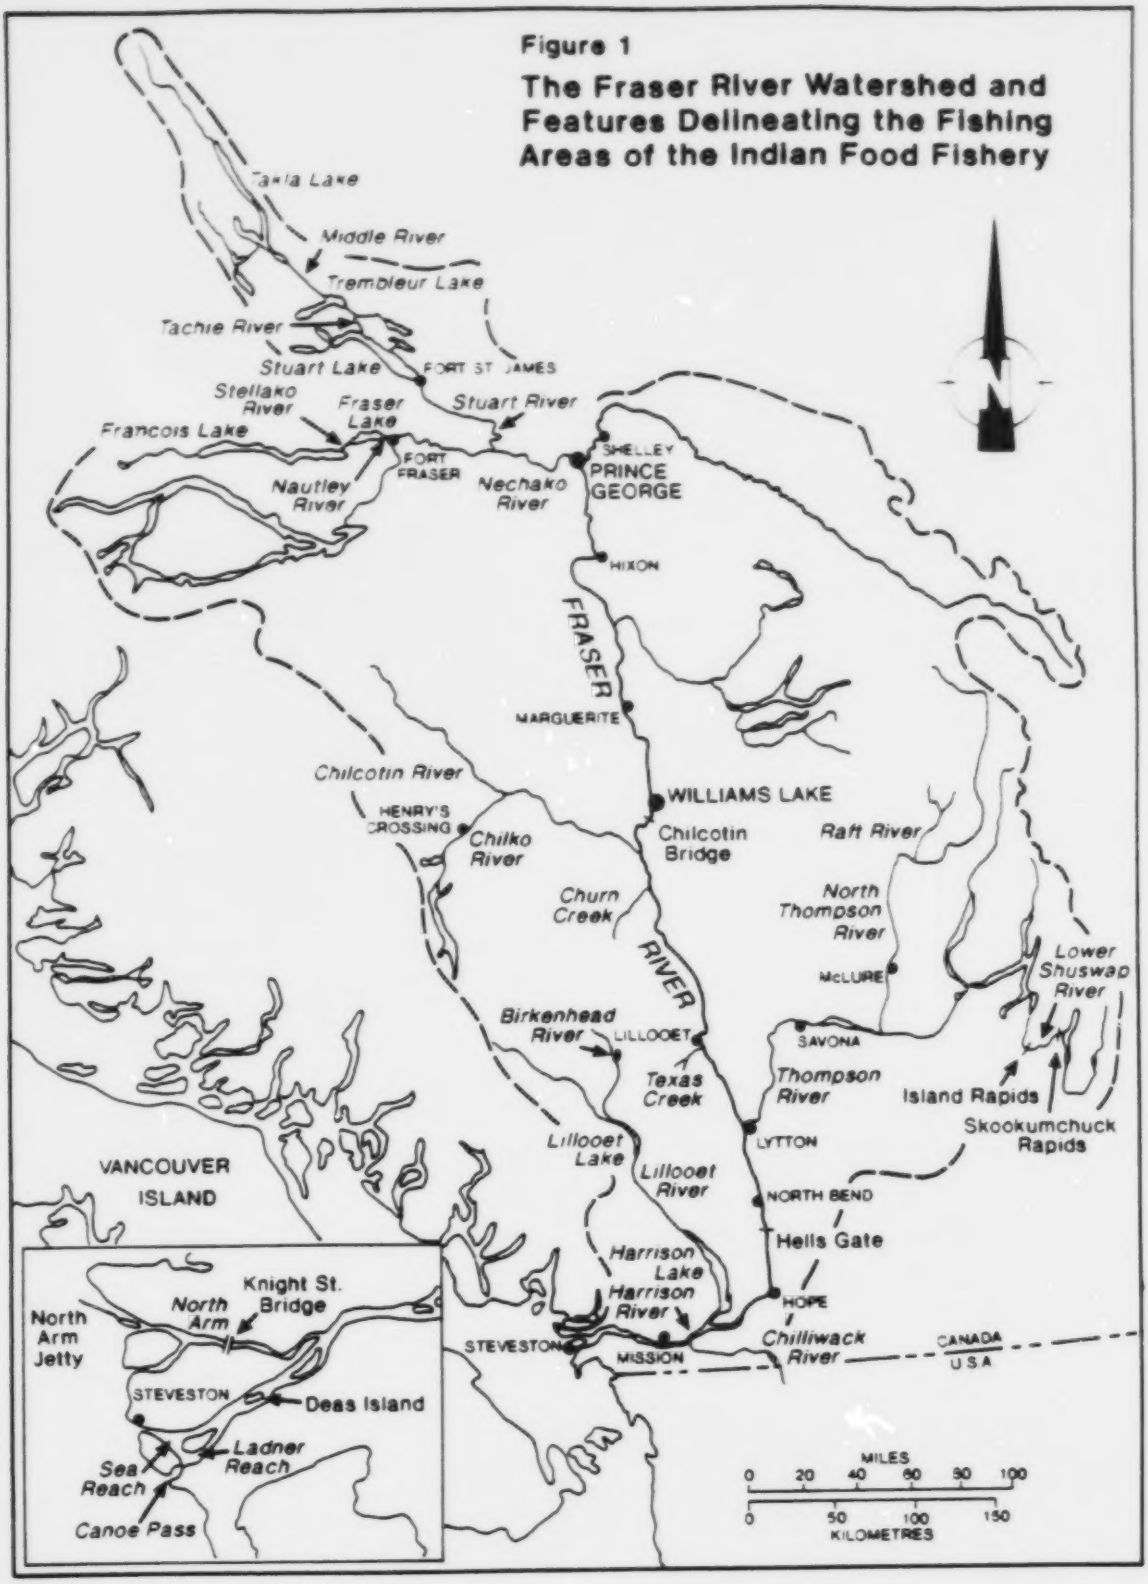
Chilcotin Bridge (491 km) to Marguerite (552 km); dip nets.

Marguerite (552 km) to Hixon (689 km); dip nets.

Above Hixon (689 km); set gill nets. Fishing in this area is conducted in

Figure 1

The Fraser River Watershed and Features Delineating the Fishing Areas of the Indian Food Fishery



the Fraser River between Hixon and Prince George (768 km) and at Shelley (773 km). No fishing occurs in the mainstem or tributaries of the Fraser River upstream of Shelley.

Nechako and Stuart River Systems; set gill nets. These two systems are divided into six sub-areas as follows:

a. Nechako River

- Prince George (768 km) to the Stuart River mouth (855 km).

- Stuart River mouth (855 km) to Fort Fraser (958 km), including the Nautley River.

- Fort Fraser (958 km) to Francois Lake (990 km). Fishing occurs along the shore of Fraser Lake adjacent to the reserves at Lejac and the Fraser Lake town site, and in the lower 200 m of the Stellako River.

b. Stuart River

- Stuart-Nechako river confluence (855 km) to Fort St. James (967 km). Most fishing occurs at the outlet of Stuart Lake.

- Fort St. James (967 km) to the Trembleur Lake outlet (1,035 km). Fishing occurs principally in the Tachie River at Grand Rapids and in Trembleur Lake adjacent to the Tachie River mouth.

- above the Trembleur Lake outlet (1,035 km). Fishing is conducted at the mouth of the Middle River.

Chilcotin River System

- Chilcotin River; from the Fraser River (460 km) to the Chilko River confluence (549 km); dip nets.

- Chilko River; from the Chilcotin River confluence (549 km) to Henry's Crossing (628 km); dip nets and gaffs.

Thompson River System

- Thompson River; Lytton (254 km) to Savona (368 km); set gill nets and dip nets.

- Shuswap River; from the Islands (610 km) to Skookumchuk Rapids (653 km); spears and gaffs.

- North Thompson River system; North Thompson mainstem above McLure (413 km); set gill nets; and in the Raft River (545 km); spears and gaffs.

Harrison-Lillooet River System

- Harrison River; mainstem (from 102 km to 121 km); set gill nets and spears.

- Lower Lillooet River; head of Harrison Lake (182 km) to the Lillooet Lake outlet (240 km); set gill nets.

- Birkenhead River (268 km); includes a set gill net fishery at the upper end of Lillooet Lake and a gaff fishery in the Birkenhead River.

1989 CATCH

Catches of salmon and steelhead by the IFF are presented by year from 1951 to 1989 in Table 1 and by area for 1989 in Table 2. The total annual catch of 674,023 salmon and steelhead in 1989 was the highest of the 1951-89 period. The chinook catch of 5,983 fish was 64% below the 1981-89 average. The catch of 571,943 sockeye was the largest annual catch within the 1951-89 period and represented 85% of the salmon total. The pink catch of 72,443 fish was near to the 1981-

89 average. The catch of 10,245 coho was the second lowest in the past 22 years. The chum catch of 12,785 fish was the lowest in four years. The steelhead catch of 624 fish was the lowest since 1978 and the second lowest in the 1951-89 period.

The majority of the total catch in 1989 was taken in the mainstem of the Fraser River downstream of Churn Creek (85%). The greatest proportion of catch of any area in the fishery occurred between Mission and Hope (31%) and Hope and North Bend (23%).

MANAGEMENT PROCEDURE

The IFF is regulated to conserve the salmon resource and provide fishing opportunities for food. The standard fishing plan for the fishery, which has not changed significantly since 1962, is shown in Table 3a. Prior to 1986, two regulatory measures were used in the management procedure: restrictions of fishing times and restrictions in the type and characteristics of gear. The durations of weekly open periods vary within the fishery because stock abundances and gear efficiencies differ between areas. For example, the fishery between Deas Island and North Bend is open for three days per week because most Fraser River stocks of all five salmon species and steelhead are available to the relatively efficient gear used in this area. In comparison, the fishery between Churn Creek and Hixon and in the Chilcotin River system is open seven days per week because the number of salmon species, and abundance and seasonal occurrence of stocks are considerably reduced. Additionally, the dip nets used in these areas are less efficient than set gill nets used in the lower parts of the river, and the number of fishing sites may be limited. Gear restrictions apply to the type and characteristics of gill nets and are used as a method of limiting net efficiency which cannot be compensated for by varying the duration of openings. Since 1986, an annual allocation of 500,000 sockeye has been established for the entire fishery in addition to time and gear regulations.

Each year a pre-season plan is developed by amending the standard plan if conservation and allocation concerns need to be addressed. The proposed pre-season plan is usually finalized after consultation with Indian groups.

With the introduction of allocations, the fishery is actively managed during the season through amendments to the pre-season plan. Changes are also made during the season if emergency in-season conservation concerns arise. The sockeye allocation for 1989 was divided between three stock groupings (Early Stuart, and summer and late timed runs) and three areas (Steveston area, and below and above North Bend) on the basis of catch divisions for the previous four cycle years. During the season the weekly catch of sockeye is compared to pre-season projections derived from historic weekly catch rates and the allocations. Adjustments of fishing time are made in an attempt to provide opportunities to obtain the allocations.

The Interior Indian Fisheries Commission (IIFC) was established to represent the fishing interests of many Indian bands and tribal councils throughout the Fraser River watershed and act as a consultative group for the IFF. The IIFC may consist of representatives from each of the following ten tribal councils: Carrier-Sekani Tribal Council, Cariboo Tribal Council, Chilcotin-Ulkatcho-Kluskus Nation, Lillooet Tribal Council, Nlaka'Pamux Tribal Council, Okanagan Tribal Council, Kootenay Indian Area Council, Sto:Lo Nation, and Sto:Lo Tribal Council.

1989 PRE-SEASON MANAGEMENT PLAN

The pre-season plan for the IFF is shown in Tables 3b and 3c. Early and middle runs of chinook, and the Harrison River chinook stock required conservation for the 1989 season. Two management actions were taken in an attempt to reduce catches from these stocks:

1. For early timed chinook, fishing times in the mainstem of the Fraser River downstream from North Bend, the major area of chinook interception, were reduced to one day per week during the chinook-directed fishery between late February and late June. Similar conservation measures for this run have been implemented annually since 1977. In the Lillooet River system, fishing times were reduced to one day per week from April to mid-June. This was the fourth consecutive year for restrictions in this system;

2. For middle run and Harrison River chinook stocks, a restriction was placed on the mesh size of gill nets to a maximum of 140 mm (5.5 inches) to reduce incidental interceptions of chinook during the sockeye-directed fishery. This was the seventh consecutive year of mesh size restrictions for middle run chinook and the first year of such a restriction for Harrison chinook.

In 1989, for the fourth consecutive year, a catch allocation of 500,000 sockeye for the entire fishery was established by DFO. The catch was divided by sockeye run timing period as follows: 142,000 Early Stuart sockeye, 338,000 summer run sockeye and 20,000 late run sockeye. These sub-allocations were further subdivided into geographic components as follows: 1. Steveston area - 4,000 Early Stuart, 21,000 summer and 1,000 late run sockeye; 2. Below North Bend - 77,300 Early Stuart, 119,300 summer and 16,400 late run sockeye; 3. above North Bend - 60,600 Early Stuart, 197,800 summer and 2,600 late run sockeye. Allocations were not established for other species.

IN-SEASON AMENDMENTS

Changes were made to the pre-season plan to address sockeye allocation and in-season conservation concerns, and to respond to a toxic chemical spill. In the Steveston area, reductions of fishing time and a closure was implemented in an attempt to keep sockeye catches on allocation schedules; and an additional opportunity was provided on the week ending September 3 to address an impact on catches caused by a chemical spill. In the area between Deas Island and North Bend, additional and reduced time was scheduled during the Early Stuart sockeye run to keep catches on the allocation schedule; additional time was provided to respond to lost opportunities as a result of the chemical spill; additional time was scheduled from Deas Island to Mission to compensate for Area 29 commercial fishery impacts which reduced sockeye abundance; and to address a steelhead conservation concern, fishing time was reduced for four weeks in October in the Fraser River mainstem from the Harrison River confluence to North Bend. Above North Bend, additional openings were provided in the area between North Bend and Churn Creek from mid-August to mid-September in attempts to keep summer run sockeye catches on the allocation schedule.

Sockeye allocations were adjusted during the season because the Early Stuart allocations were exceeded in the Steveston area and from Deas Island to North Bend. The allocations of ensuing sockeye runs for each of these areas were changed to compensate for the over-harvest of Early Stuart

sockeye to keep the catch within the total sockeye allocation for the year. The summer and late run allocations were reduced proportionally by the amount the Early Stuart allocation was exceeded. The adjusted allocations were as follows: in the Steveston area - 7,200 Early Stuart, and 17,900 summer and 900 late run sockeye; between Deas Island and North Bend - 118,400 Early Stuart, and 83,300 summer and 11,300 late run sockeye. No such adjustments were required for the area above North Bend.

The sockeye allocation was also adjusted to accommodate changes made to the plan as a result of the chemical spill. The adjustment was calculated by deducting, from the current catch, the estimated number of sockeye taken during the period for which an advisory was issued to not consume fish, and also the catch that may have occurred during foregone fishing opportunities. The deductions were 4,100 sockeye in the Steveston area and 35,800 sockeye from Deas Island to North Bend. Additional fishing opportunities were provided to replace these fish. Fish harvested during the period in which a concern existed about the spill were included in the catch estimates of this report.

The consultative process established with native groups in past years was continued in 1989. Meetings were held prior to and during the fishing season with various bands, tribes, and other groups to discuss management plans and facilitate in-season changes to these plans. Throughout the fishing season weekly information bulletins were sent to all Indian bands and groups to provide them with up-dated information on the status of returning salmon stocks, management plans for the IFF, and Indian food and commercial fishery catches.

DATA SOURCES

Effort and catch statistics of the IFF are estimated in each fishing area and compiled weekly by fisheries officers of DFO. Gear counts may be obtained from river, foot or aerial surveys. CPUE and catch may be estimated from interviews with or direct observation of fishermen and by physical inspection of deployed nets. Generally, each area of the fishery is surveyed one or more times during each weekly open period. Catch and effort estimation methods and intensity of assessment are dependent on characteristics of the fishery and extent of resources and as a result may vary between areas and within each area throughout the year.

DATA ORGANIZATION AND INTERPRETATION

The weekly number of open days, daily number of nets, and net-days per week of effort in 1989 are presented by area and gear type in Table 4. The net-days per week of effort were calculated by multiplying the number of days open for fishing each week by the number of nets observed.

All catch data are reported as number of fish (pieces). Annual catches of salmonid species by area for the 1951 to 1989 period are summarized in Table 5. Weekly catches of salmonid species and sturgeon by area in 1989 are presented in Table 6. In Table 6, non-numeric entries represented by hyphens that are not accompanied by a footnote indicate weekly openings when no effort was expended (e.g. no nets present).

Weekly CPUE of each salmonid species and sturgeon by area and gear type in 1989 is shown in Table 7. CPUE was calculated by dividing the total weekly catch by the total weekly effort and is expressed in units of catch per net-day. In the CPUE tables, non-numeric entries represented

by hyphens indicate weeks when no effort was expended. CPUE was not calculated for the two areas between North Bend and Churn Creek in the mainstem of the Fraser River and the area between Lytton and Savona in the mainstem of the Thompson River because separate estimations of catch for each of the two gear types used in these areas (set gill nets and dip nets) were not reported.

ACKNOWLEDGEMENTS

I thank L. Currie for typing the manuscript.

	01-Mar to 11-Jun	1	1200 Sat to 1200 Sun	early chinook

Table 3c. Preseason management plan (gear restrictions) for the Fraser River Indian food fishery for the period 1 June 1989 to 31 May 1990. No in-season amendments occurred.

Gear restriction	Fishing area	Time period	Conservation requirement
1. Use of monofilament nylon gill nets prohibited (a)	Entire fishery	All year	All species
2. Maximum set gill net length of 18.3 m (10 fathoms)	Entire fishery except Lillooet River system, and Stuart, Trembleur, Takla and Fraser lakes	All year	All species
3. Maximum set gill net length of 36.7 m (20 fathoms)	Lillooet River system	All year	All species
4. Maximum set gill net length of 31.0 m (17 fathoms)	Stuart, Trembleur, Takla and Fraser lakes	All year	All species
5. Maximum drifted gill net length of 45.7 m (25 fathoms)	Steveston area	All year	All species
6. Maximum gill net mesh size of 140 mm (5.5 inches)	Steveston area	1200 June 23 to 2400 Oct 14	middle timed chinook and Harrison chinook
	Deas to Agassiz - Rosedale bridge	1800 June 20 to 1800 Oct 1 1200 Oct 2 to 1200 Oct 22	middle timed chinook and Harrison chinook
	Agassiz - Rosedale bridge to North Bend	1800 June 23 to 1800 Sep 17	middle timed chinook
	North Bend to Ainslie Creek	1800 June 20 to 1800 Sep 16	middle timed chinook
	Ainslie Creek to Lytton	1800 July 24 to 1800 Sep 17	middle timed chinook

a. The definition of a monofilament net is as follows: the web does not contain any single filament that weighs more than 50 grams per 9000 meters of filament (50 deniers).
